

Scag Scapes Growth Blueprint

and 24-month proforma

Two crews at 900 LF a month, a recurring Drain Check book, and a business that runs on data - grown in a logical, safe order.

Prepared for Charlie Mascagni, Scag Scapes LLC
By Ned Pearson - Baton Rouge - September 2026

Companion workbook: Scag-Scapes-Proforma.xlsx - every number here is a formula there; change the yellow cells and both move. Your proposal template stays exactly as it is. The software feeds it numbers and the Moasure map; it does not replace it.

The plan in one page

\$622K

Year 1 revenue in the base case
(one crew ramping, second crew
from month 7)

\$936K

Year 2 revenue with two crews at
900 LF and 150+ Drain Check
customers

\$285K

Year 2 operating profit after a
\$6,000/month owner draw,
marketing, and the Crew 2 loan

152

Drain Check maintenance
customers at month 24 - the
recurring, sellable part of the
business

Charlie's goal is 800-1,000 linear feet a month per three-man crew, two crews, 50% margin after labor, materials and fuel, selling to homeowners 50-75 within 20 miles of 70808. The numbers say the goal is reachable in about ten months without borrowing against the house, if five things happen in this order:

- **Answer every lead in 60 seconds and quote the same day.** Command does this today. It is the single biggest lever: 27% of home-service calls go unanswered and 85% of those callers never call back.
- **Buy leads where the 50-75 homeowner actually is:** Google Local Services Ads for people searching 'french drain Baton Rouge' (\$59/lead, 39.5% book rate) and Facebook - 79% of 50-64s and 69% of 65+ use it - for the neighbors who did not know they needed you yet. Budget starts at \$1,800/month and scales with the second crew.
- **Sell the Drain Check plan on every quote and every warranty walk.** Water-jet clean plus flow test, \$249 a year, 72% margin, 40% attach rate. It fills slow weeks, makes customers permanent, and turns a job shop into a company with recurring revenue - the kind that sells for a multiple.
- **Start Crew 2 in month 7, rent-first.** Trigger: Crew 1 has done 900 LF for three straight months and the backlog is over four weeks. Rent the mini-ex for 90 days, buy it when Crew 2 hits target twice. Cash never drops below the opening balance in the model.
- **Run the company on the Monday dashboard.** Speed-to-lead, cost per lead by channel, close rate, LF per crew, margin per job, plan attach rate, cash. Every lever in this plan is a setting in the software, not a rebuild.

Where the numbers stand today, and what they imply

Charlie's figure	What the model does with it	What it implies
50% margin after materials, fuel and labor	Direct labor 32% + materials/fuel 20% of revenue; gross margin 48%	Every 100 LF sold at \$42/LF puts \$2,016 in gross profit. Overhead is the only thing between that and cash.
Crew paid \$20-25/hr, 3 per crew	$3 \times 173 \text{ h} \times \$22.50 \times 1.14 \text{ burden} = \$13,312 \text{ per crew-month}$	At 900 LF and \$42/LF, fully-loaded labor is 35% of revenue, not 32%. It reaches 32% at about 1,000 LF. Productivity per crew-day IS the margin - which is why the readiness gate and breakdown flow are in the plan, not just marketing.
Goal: 800-1,000 LF/month per crew	Crew 1 ramps 650 to 900 by month 6; Crew 2 from 500 to 900 in four months	One crew at 900 LF = \$37,800 revenue and \$18,144 gross profit per month.
Two crews	Crew 2 starts month 7, rent-first, financed purchase in month 10	Two crews at target = about \$75,600/month. Marketing budget scales 1.6x when Crew 2 starts so demand keeps up.
Water-jet maintenance, yearly or every 2 years	Drain Check plan: \$249/visit, \$70 cost, annual	\$895 gross profit per customer over five years before any referral.
Moasure on every proposal	CSV import into the quote builder (built this week); PDF attached to your template	Run length and fall come off the survey, not a tape; the 1% slope check is automatic.

Break-even with one crew is 580 LF a month - 64% of one crew's target. Everything past that is profit, and that is why the plan can afford to grow carefully.

The market inside 20 miles of 70808

456,180

people in East Baton Rouge Parish (2025 est.), 17.4% age 65+ (Census QuickFacts)

59.3%

owner-occupied; 210,707 housing units; median home \$248,800 (Census, 2020-24)

\$411K+

median home value in 70808 itself; 56% owner-occupied; heavy 1970-1989 housing stock (City-Data / ACS 2024)

60.65"

of rain a year - about double the U.S. average (usclimatedata.com)

How big is the pond

Owner-occupied homes in EBR alone: roughly 125,000 (210,707 units x 59.3%). Nationally about a third of owner households are headed by someone 50-74, so the 50-75 owner segment inside the parish is on the order of **40,000 homes** before adding the Ascension, Livingston and West Baton Rouge portions of the 20-mile circle (assumption, flagged in the workbook). Two crews at target complete about 216 jobs a year - **half of one percent** of that segment. This plan is capacity-constrained, not demand-constrained; the job is to be the company they find first.

Why 50-75 in this ZIP is the right customer

- They own, they have equity, and their houses were built when drainage was an afterthought - the 1970-89 stock in 70808 is exactly where original drains have failed.
- They pay for a person who shows up, a printed proposal with a map, and a warranty with a term. All three are Charlie's strengths and none of the seven competitors offers them (see the app's Competitive edge page).
- They are on Facebook: 79% of 50-64s and 69% of 65+ (Pew, 2025). Only 35% and 19% are on Instagram - Instagram is for the 40-year-old daughter who finds the contractor for her parents, not the primary channel.
- They call. The phone is the channel, which is why the 60-second text-back plus a same-day call-back is the core of the growth engine - not a web funnel.
- The parish cannot help them: \$150M+ of drainage work waiting on FEMA (WBRZ, Aug 2026) and years of unanswered 311 complaints (WAFB, May 2026).

The growth engine: leads to installed feet

Channel	Monthly budget	Cost per lead	Close rate	Jobs / month	Why it works for this customer
Google Local Services Ads (drain / sewer, 20-mi radius)	\$900 (x1.6 with Crew 2)	\$59 (SearchLight, Feb 2026)	35% (LSA book rate 39.5%)	~5	Highest intent: the yard is flooding right now and they typed it into Google. Google-guaranteed badge matters to this age group.
Facebook + Instagram ads (age 50-75, homeowners, 20 mi of 70808)	\$600 from month 2 (x1.6 with Crew 2)	\$55 (landscaping \$45-80, 2026)	18%	~2	Reach the neighbor whose yard floods every spring but has not searched yet. Rain-day creative. Instant text-back keeps these from going cold.
Organic: reviews, referrals, Google Business Profile, parish pages, rain trigger	\$300 content	near \$0	45%	~3 growing 6%/mo	Reviews compound. Every completed job asks for one; every warranty walk asks for a referral; every rain event texts past customers' neighbors.
Total	\$1,800 -> \$2,700	~\$45 blended	~30%	~10 -> 16	About 1,000 LF a month of demand at 100 LF per job - matched to one crew, then scaled to two.

The rules that make paid leads pay

- **60 seconds.** Every lead gets a text with the price range and two open estimate slots before a human is involved. Call-back inside 5 minutes when Charlie is free; the app shows who is waiting.
- **Same-day quote with the Moasure map** in Charlie's own template. The map is the close - nobody else in the market brings one.
- **Track cost per job, not cost per lead.** The dashboard shows it by channel every Monday; a channel that goes over \$500 per job for two weeks gets its budget moved.
- **Do not buy leads you cannot install.** The proforma caps backlog at one month of capacity; beyond that the customer calls the next company. When backlog passes four weeks, the answer is Crew 2, not more ads.

Facebook first, Instagram present, YouTube for proof

Platform	Reach in the target (Pew 2025)	Role	What to post	Cadence
Facebook	79% of 50-64 - 69% of 65+	Primary. Paid + organic + neighborhood groups.	Rain-day 'is your yard holding water?' posts within 12 hours of a storm; before/after with the Moasure map; 60-second explainers ('why the water sits at your slab'); customer thank-yous with names (permission); crew at work; the Drain Check plan.	3 organic posts/week; 1 boosted rain post per event; ads always on
Instagram	35% of 50-64 - 19% of 65+	Secondary. The adult children and realtors.	Same before/after as Reels; time-lapse of a trench day; 'the map' carousel.	2/week, cross-posted from Facebook
YouTube	74% of 50-64 - 55% of 65+	Proof library, linked from quotes and the website.	One 3-minute walkthrough per month: a real job from flooded yard to flow test. Searchable: 'french drain Baton Rouge'.	1/month
Google Business Profile	The map pack - where 'french drain near me' is won	Where reviews live.	Photos weekly, a post after every rain, Q&A; answered, services and price range listed.	Weekly
Nextdoor	Parish-level word of mouth, older skew	Recommendations engine.	Business page; ask happy customers to recommend; answer drainage questions in the feed.	As it comes

Ad targeting and creative that fits the demographic

- Targeting: 20-mile radius of 70808, ages 50-75, homeowners; exclude renters and under-35. Lead form with two fields (name, phone) - the app calls back; no long forms.
- Creative: a real Baton Rouge yard, Charlie's face, the printed map, the warranty line. No stock photos. Large type. The word 'engineer' and the phrase '1-year workmanship warranty' in every ad.
- Impact the model expects: about 11 leads and 2 jobs a month at \$600, rising with Crew 2 - roughly \$8,400 of monthly install revenue from a \$600 spend, plus the plan customers those jobs become. Measured, not assumed: every lead is tagged by source in the app.

Drain Check: the recurring book that sells the company

\$249

per annual visit; Angi 2026 hydro jetting \$350-600 (avg \$475) - priced under market on purpose

72%

gross margin per visit: one tech, two hours, jetter already owned, fuel and water (\$70 cost)

\$895

five-year gross profit per plan customer, before the referral one in four of them sends

\$29K

year-2 plan revenue at 40% attach on new installs plus 15% of past customers

How it is sold - three moments, all automated

- **On the quote:** a line under the warranty - 'Drain Check: we come back every year, jet the lines, test the flow, \$249.' Pre-checked on the proposal; the customer removes it rather than adds it.
- **At the 11-month warranty walk:** the app schedules the walk, the tech does the first jetting as part of it, and offers the plan at the door. This is also the referral ask.
- **After every rain event:** past customers without a plan get one text: 'Your drain is 2 years old - want it jetted before the next storm?'

Why it matters more than its revenue line

- **Cash flow smoothing:** plans are scheduled into the weeks installs are thin (August heat, December). A crew member with the jetter does 4-5 visits a day - \$806 of gross profit on a day that would otherwise be idle.
- **Retention and referrals:** a customer you see every year refers; one you saw once does not.
- **Enterprise value:** a contractor with 150-300 recurring-service customers and a documented process is bought as a business, not as a truck and a mini-ex. Recurring revenue is what a buyer pays a multiple for.
- **Scalable:** it does not need Charlie. It needs a checklist (in the app), a tech, and the jetter. That is the first job a Crew 2 lead can own.

Crew 2 without betting the company

The trigger, not the date

Crew 2 starts when three things are true at the same time, all visible on the dashboard: Crew 1 has installed 900+ LF for three consecutive months; backlog has exceeded four weeks for two consecutive weeks; and cash is above two months of overhead (about \$23,400). In the base case that is month 7. If demand lags, the date moves and nothing is lost.

Step	What	Cost / timing	Safeguard
1. Lead	Promote Crew 1's best hand to Crew 2 lead; hire two laborers at \$20-22	Hiring + 2 weeks shadowing: \$4,500 one-time	Readiness gate and breakdown flow let a lead run a job without Charlie on site
2. Equipment	Rent a 3.5-4 ton mini-ex for the first 90 days (live rates in the app; ~\$2,000/mo)	Months 7-9	No loan until Crew 2 proves it; app shows on-hand at Coursey/Denham Springs
3. Buy	Used mini-ex + dump trailer + tools (~\$65K) and a used 3/4-ton truck (~\$35K), 80% financed, 60 months	Month 10: \$20,000 down, ~\$1,661/month	Only after Crew 2 hits 900 LF twice
4. Marketing	LSA and Meta budgets x1.6 from Crew 2's start month	\$1,500 -> \$2,400 paid + \$300 content	Cost per job by channel on the Monday dashboard; cut what does not convert
5. Territory	Split the 20-mile circle: Crew 1 south/east (70808, 70810, 70817, Prairieville), Crew 2 north/west (Central, Zachary, Port Allen)	Parish landing pages go live the same month	Less windshield time per LF - the second productivity lever

The productivity lever nobody talks about: at \$22.50/hr the difference between 900 and 1,000 LF a month is three points of margin. Trucks that leave loaded, machines that do not sit broken, and quotes that do not need a second visit are worth more than a price increase.

The proforma, summarized

	Q1	Q2	Q3	Q4	Year 1	Q5-Q6	Q7-Q8	Year 2
Linear feet installed	2,100	2,550	4,600	5,400	14,650	10,800	10,800	21,600
Install revenue	\$88,200	\$107,100	\$193,200	\$226,800	\$615,300	\$453,600	\$453,600	\$907,200
Drain Check revenue	\$101	\$945	\$2,230	\$3,825	\$7,101	\$12,055	\$16,908	\$28,962
Total revenue	\$88,301	\$108,045	\$195,430	\$230,625	\$622,401	\$465,655	\$470,508	\$936,162
Direct costs (labor, materials, fuel, visits)	\$45,892	\$55,958	\$101,091	\$119,011	\$321,952	\$239,261	\$240,625	\$479,886
Gross profit	\$42,409	\$52,087	\$94,339	\$111,614	\$300,449	\$226,394	\$229,883	\$456,276
Overhead incl. owner draw, marketing, Crew 2	\$34,500	\$35,100	\$48,300	\$42,782	\$160,682	\$85,564	\$85,564	\$171,128
Operating profit	\$7,909	\$16,987	\$46,039	\$68,832	\$139,767	\$140,830	\$144,319	\$285,148
Cash balance, end of period	\$30,704	\$47,250	\$91,035	\$139,475	\$139,475	\$280,305	\$424,623	\$424,623

Scenario (month-24 run rate)	Conservative	Base - Charlie's goal	Stretch
LF per crew / crews / \$ per LF	700 / 1 / \$38	900 / 2 / \$42	1,000 / 2 / \$46
Monthly revenue	\$27,430	\$77,468	\$94,905
Operating profit per year (run rate)	\$19,976	\$280,438	\$383,852
Operating margin	6%	30%	34%

Conventions: revenue in month of install; 30% deposit at signing, 90% of the balance in the month of completion, 10% the month after; payroll burden 14%; no income tax modeled (pass-through). Owner draw \$6,000/month is inside overhead. The growth-and-operations lead line is left at \$0 - terms to be agreed separately.

Cash flow: how the growth pays for itself

\$25,093

lowest cash balance in 24 months (month 1)
against a \$25,000 opening balance - the plan
never dips below the start

\$139,475

cash at end of year 1, after Crew 2's rental,
hiring and the equipment down payment

\$424,623

cash at end of year 2 - the buffer that funds
Crew 3, a second jetter, or a buyout
conversation

Rules that keep it that way

- **30% deposit by text at acceptance, balance link the day the flow test passes.** The app sends both; nobody chases a check. Cash arrives the same month the labor is paid.
- **Two months of overhead in the bank before any hire or purchase** (about \$23,400). The dashboard shows the number; the rule is written down.
- **Rent before buy, finance before cash.** Equipment is financed at 80% over 60 months; the jetter and the first mini-ex are already owned. A loan payment of ~\$1,661 a month against a crew that produces \$18,144 a month is the right ratio.
- **Drain Check is prepaid.** Annual plans are billed at signing or at the visit; either way the cash comes before the cost, and the visits are scheduled into thin weeks.
- **Buy materials off the live comparison, pay in the month of install.** A 10-15% swing in aggregate and pipe across the parish is real; the app shows it before the truck rolls.
- **Open a line of credit while you do not need it** (year 1, when the bank sees the deposits). It is the backstop for a wet spring that books three crews of work at once.

Your proposal template stays. The software feeds it.

Charlie's proposal is the customer-facing document and it is not changing. Scag Scapes Command sits behind it: it answers the phone, books the estimate, takes the Moasure survey, prices the job, produces the numbers and the map for the template, collects the deposit, schedules the crew, buys the materials, asks for the review and sells the Drain Check plan. Every setting that drives this plan is a field in the app, not a line of code.

Step in the day	What Command does	Setting Charlie controls
Phone rings while he is in a trench	Text-back in 60 s with the price range and two open slots; homeowner picks one by replying	Price range, hours, slot times, message wording
Estimate visit	Moasure survey: export CSV from the Moasure app, import into the quote builder - run length, fall and the 1% slope check fill in automatically (built this week)	Slope minimum, waste factor, materials list per service
Proposal	Numbers and BOM go into Charlie's own template; the Moasure PDF (with logo, scale and elevations) is attached	Deposit %, warranty wording, inclusions and exclusions
Sold	Deposit link by text; job requirements list from the survey; readiness gate before the truck leaves	Approval limits, crew assignments
On site	Breakdown flow, live rental and material comparison, call packages	Recovery weights, crew cost per hour, preferred vendors
Done	Balance link, review ask, Drain Check offer, 11-month warranty walk scheduled, referral ask	Timing of each message, plan price
Every Monday	Dashboard: speed-to-lead, leads and cost per job by channel, close rate, LF per crew, margin per job, plan attach, cash	Which KPIs are on the front page

Moasure has no public API (checked Sept 2026); it exports PDF, DXF/DWG, CSV point clouds and images. The CSV import is live in the quote builder now; the next step is a job-record attachment so the survey, the proposal and the flow-test photo live together for the warranty walk.

Data and analytics: what Charlie sees, and how he changes it

Question	Metric on the dashboard	Target	If it drifts
Are we answering fast enough?	Speed-to-lead (median seconds to first text and to first human)	< 60 s text; < 5 min human	The app already texts; check call-back habits
Are the ads working?	Leads, jobs and cost per job - by channel	< \$450 per job blended	Move budget between LSA and Meta; pause a channel for 2 weeks
Are we closing?	Quote-to-sale by channel and by ZIP	> 35% search, > 20% social, > 45% referral	Look at price-per-LF outliers and quote turnaround
Are crews productive?	LF per crew per day; jobs needing a second visit; breakdown hours	43+ LF/day; < 5% revisits	Readiness gate compliance; breakdown response times
Are we making money on each job?	Gross margin per job vs. quoted; materials variance	48% +/- 3	Materials price alerts; discount discipline (the app shows margin impact before a discount)
Is the recurring book growing?	Drain Check attach rate; active plans; visits due this month	40% attach; 150 active by month 24	Put the plan back on the proposal first page; warranty-walk script
Are we safe?	Cash balance vs. two-months-overhead rule; backlog weeks	Cash > \$23,400; backlog 2-4 weeks	Backlog > 4 weeks for 2 weeks = the Crew 2 trigger

Changing the plan takes a minute, not a developer

- Price per LF, deposit %, rain threshold, message wording, approval limits, recovery-option weights, crew cost per hour, plan price - all are settings screens in the app. Change one, and every quote, text and ranking uses it from that moment.
- The proforma workbook is the same idea on paper: yellow cells are the levers, everything else recalculates. Charlie's real figures replace the estimates as the dashboard produces them - month by month the model becomes his actuals.
- Reports page exports: leads by source, jobs by ZIP, margin by job, plan customers, provider performance. Every number is traceable to the record it came from - no black box.

Twelve-month roadmap with kill criteria

Quarter	Build	Sell	Measure	Go / no-go at quarter end
Q1 (months 1-3)	Phone, deposit and review links live; price range and warranty published; GBP verified; Moasure import in every quote; Drain Check price and script	LSA on month 1, Meta month 2; every quote through Command; plan offered on every quote from month 3	Speed-to-lead, cost per job by channel, close rate	Go if 100% of leads answered, cost per job < \$500, Crew 1 at 750+ LF in month 3
Q2 (4-6)	Parish pages; YouTube proof library; readiness gate and breakdown flow on the crew phones; warranty-walk automation	Rain campaigns measured per event; reviews to 25+; plan sold at every warranty walk	LF per crew-day, backlog weeks, plan attach	Go for Crew 2 if 900 LF three months running, backlog > 4 weeks, cash > 2 months overhead
Q3 (7-9)	Crew 2 hired and shadowed; mini-ex rented; territory split; marketing x1.6	Both crews fed by the same funnel; commercial intros (HOAs, property managers) begin	Crew 2 ramp vs. plan, utilization of both crews, cash	Buy equipment only if Crew 2 hits 900 LF twice; otherwise keep renting or pause
Q4 (10-12)	Equipment purchased and financed; second jetter if plan visits exceed 20/month; line of credit opened	Referral partners (WCK, roofers, gutter companies, realtors); Drain Check to past customers	Year-1 actuals vs. proforma; plan book; margin per job	Decide Crew 3 trigger, price increase (reviews + map justify \$46/LF), or hold and harvest

Risks and the safeguard for each

- **A dry season.** Rain drives demand. Safeguard: Drain Check visits and the referral ask fill dry months; marketing budget is monthly, not committed.
- **Crew 2 does not perform.** Safeguard: rent-first, buy only after two target months; the lead is promoted from Crew 1, not hired cold.
- **Lead cost creeps up.** Safeguard: cost per job by channel on the Monday dashboard; a two-week pause rule; organic share grows every month.
- **Charlie becomes the bottleneck.** Safeguard: the software answers, books, prices and schedules; the readiness gate lets a crew lead run a job; the plan business needs a tech, not the owner.
- **Price pressure from the New Orleans firms.** Safeguard: they cannot bring a map, a warranty term or a 60-second answer. Sell the engineer, not the foot of pipe.
