

# Scag Scapes Growth Blueprint

## and 24-month proforma

Two crews at 900 LF a month, a recurring Drain Check book, and a business that runs on data - grown in a logical, safe order.

Prepared for Charlie Mascagni, Scag Scapes LLC  
By Ned Pearson - Baton Rouge - September 2026

Companion workbook: Scag-Scapes-Proforma.xlsx - every number here is a formula there; change the yellow cells and both move. Your proposal template stays exactly as it is. The software feeds it numbers and the Moasure map; it does not replace it.

# The plan in one page

## \$757K

Year 1 revenue in the base case (one crew ramping, second crew from month 7)

## \$1,110K

Year 2 revenue with two crews at 900 LF and 150+ Drain Check customers

## \$373K

Year 2 operating profit after a \$6,000/month owner draw, marketing, and the Crew 2 loan

## 150

Drain Check maintenance customers at month 24 - the recurring, sellable part of the business

Charlie is at about 400 LF a month with one three-man crew and roughly \$1,500 of revenue per crew-day. His goal is 800-1,000 LF a month per crew, two crews, 50% margin after labor, materials and fuel, selling to homeowners 50-75 within 20 miles of 70808. The numbers say the goal is reachable in about ten months without borrowing against the house, if five things happen in this order:

- **Answer every lead in 60 seconds and quote the same day.** Command does this today. It is the single biggest lever: 27% of home-service calls go unanswered and 85% of those callers never call back.
- **Buy leads where the 50-75 homeowner actually is:** Google Local Services Ads for people searching 'french drain Baton Rouge' (\$59/lead, 39.5% book rate) and Facebook - 79% of 50-64s and 69% of 65+ use it - for the neighbors who did not know they needed you yet. Budget starts at \$1,800/month and scales with the second crew.
- **Sell the Drain Check plan on every quote and every warranty walk.** Water-jet clean plus flow test, \$249 a year, 72% margin, 40% attach rate. It fills slow weeks, makes customers permanent, and turns a job shop into a company with recurring revenue - the kind that sells for a multiple.
- **Start Crew 2 in month 7, rent-first.** Trigger: Crew 1 has done 900 LF for three straight months and the backlog is over four weeks. Crew 1 already owns its trailer, skid steer and mini excavator. Crew 2 gets its own set: trailer, truck and tools bought on day one; the mini-ex and skid steer rented for 90 days and bought (80% financed) once Crew 2 hits target twice. Cash stays within a few thousand dollars of the opening balance at its lowest and grows from month 3.
- **Run the company on the Monday dashboard.** Speed-to-lead, cost per lead by channel, close rate, LF per crew, margin per job, plan attach rate, cash. Every lever in this plan is a setting in the software, not a rebuild.

# Where the numbers stand today, and what they imply

| Charlie's figure                                                              | What the model does with it                                                                                                                                                                          | What it implies                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 50% margin after materials, fuel and labor; labor ~32%, materials + fuel ~20% | Materials + fuel 20% of revenue. Labor is NOT a percentage - it is the crew's wages x hours x burden, the same whether the crew installs 400 LF or 900 LF (labor method 2, switchable to a flat 32%) | At 900 LF and \$50/LF the model reproduces Charlie's rules: labor 31%, gross margin 49%. Every 100 LF job puts \$2,455 in gross profit.                                                                                                             |
| Crew paid \$20-25/hr, 3 per crew                                              | 3 x 173 h x \$22.50 + a \$3/hr lead premium, x 1.14 burden = \$13,904 per crew-month. Wage, premium, burden, hours and overtime are all yellow cells.                                                | Today, at ~400 LF/month, that crew is <b>44%</b> of revenue. At 900 LF it is <b>31%</b> . Same crew, same wages - the feet per day are the whole difference. That is why the readiness gate and breakdown flow are in the plan, not just marketing. |
| Currently ~400 LF/month; an average job day is ~\$1,500 of revenue            | Month 1 = 400 LF: about 9 crew-days on drains at \$50/LF plus 12 days of other work at \$1,000/day = \$1,509 per crew-day - the model starts where Charlie is                                        | Growth is filling every crew-day with drainage feet: 43 LF/day x 21 days = 900 LF. Crew 1 ramps 400 to 900 by month 6; one crew at 900 LF = \$45,000 revenue and \$22,096 gross profit per month.                                                   |
| Two crews; Crew 1 owns trailer, skid steer, mini-ex                           | Crew 2 starts month 7 with its own set: trailer, truck, tools bought at start; mini-ex and skid steer rented 3 months, then bought (80% financed, 60 months)                                         | Two crews at target = about \$90,000/month. \$138,500 of purchases, \$27,700 in down payments, ~\$2,300/month in loan payments once everything is owned.                                                                                            |
| Water-jet maintenance, yearly or every 2 years                                | Drain Check plan: \$249/visit, \$70 cost, annual                                                                                                                                                     | \$895 gross profit per customer over five years before any referral.                                                                                                                                                                                |
| Moasure on every proposal                                                     | CSV import into the quote builder (built this week); PDF attached to your template                                                                                                                   | Run length and fall come off the survey, not a tape; the 1% slope check is automatic.                                                                                                                                                               |

**Break-even with one crew is 640 LF a month - 71% of one crew's target. Everything past that is profit, and that is why the plan can afford to grow carefully.**

# The market inside 20 miles of 70808

**456,180**

people in East Baton Rouge Parish (2025 est.), 17.4% age 65+ (Census QuickFacts)

**59.3%**

owner-occupied; 210,707 housing units; median home \$248,800 (Census, 2020-24)

**\$411K+**

median home value in 70808 itself; 56% owner-occupied; heavy 1970-1989 housing stock (City-Data / ACS 2024)

**60.65"**

of rain a year - about double the U.S. average (usclimatedata.com)

## How big is the pond

Owner-occupied homes in EBR alone: roughly 125,000 (210,707 units x 59.3%). Nationally about a third of owner households are headed by someone 50-74, so the 50-75 owner segment inside the parish is on the order of **40,000 homes** before adding the Ascension, Livingston and West Baton Rouge portions of the 20-mile circle (assumption, flagged in the workbook). Two crews at target complete about 216 jobs a year - **half of one percent** of that segment. This plan is capacity-constrained, not demand-constrained; the job is to be the company they find first.

## Why 50-75 in this ZIP is the right customer

- They own, they have equity, and their houses were built when drainage was an afterthought - the 1970-89 stock in 70808 is exactly where original drains have failed.
- They pay for a person who shows up, a printed proposal with a map, and a warranty with a term. All three are Charlie's strengths and none of the seven competitors offers them (see the app's Competitive edge page).
- They are on Facebook: 79% of 50-64s and 69% of 65+ (Pew, 2025). Only 35% and 19% are on Instagram - Instagram is for the 40-year-old daughter who finds the contractor for her parents, not the primary channel.
- They call. The phone is the channel, which is why the 60-second text-back plus a same-day call-back is the core of the growth engine - not a web funnel.
- The parish cannot help them: \$150M+ of drainage work waiting on FEMA (WBRZ, Aug 2026) and years of unanswered 311 complaints (WAFB, May 2026).

# The growth engine: leads to installed feet

| Channel                                                                          | Monthly budget                        | Cost per lead                    | Leads that book an estimate    | Jobs / month (at 70% close) | Why it works for this customer                                                                                                                 |
|----------------------------------------------------------------------------------|---------------------------------------|----------------------------------|--------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Google Local Services Ads (drain / sewer, 20-mi radius)                          | \$900 (x1.6 with Crew 2)              | \$59 (SearchLight, Feb 2026)     | 50% (industry book rate 39.5%) | ~5                          | Highest intent: the yard is flooding right now and they typed it into Google. Google-guaranteed badge matters to this age group.               |
| Facebook + Instagram ads (age 50-75, homeowners, 20 mi of 70808)                 | \$600 from month 2 (x1.6 with Crew 2) | \$55 (landscaping \$45-80, 2026) | 30%                            | ~2                          | Reach the neighbor whose yard floods every spring but has not searched yet. Rain-day creative. Instant text-back keeps these from going cold.  |
| Organic: reviews, referrals, Google Business Profile, parish pages, rain trigger | \$300 content                         | near \$0                         | 65%                            | ~3 growing 6%/mo            | Reviews compound. Every completed job asks for one; every warranty walk asks for a referral; every rain event texts past customers' neighbors. |
| Total                                                                            | \$1,800 -> \$2,700                    | ~\$45 blended                    | ~45% book, then 70% close      | ~10 -> 16                   | About 1,000 LF a month of demand at 100 LF per job (\$5,000 all-in) - matched to one crew, then scaled to two.                                 |

**Close rate is Charlie's number.** The model uses 70% of estimates run turning into sold jobs - his figure - as one yellow cell on the Assumptions tab. Change it and every channel, month, scenario and the lead count needed all move. Leads-to-estimate rates are per channel and also adjustable.

## The rules that make paid leads pay

- **60 seconds.** Every lead gets a text with the price range and two open estimate slots before a human is involved. Call-back inside 5 minutes when Charlie is free; the app shows who is waiting.
- **Same-day quote with the Moasure map** in Charlie's own template. The map is the close - nobody else in the market brings one.
- **Track cost per job, not cost per lead.** The dashboard shows it by channel every Monday; a channel that goes over \$500 per job for two weeks gets its budget moved.
- **Do not buy leads you cannot install.** The proforma caps backlog at one month of capacity; beyond that the customer calls the next company. When backlog passes four weeks, the answer is Crew 2, not more ads.

# Facebook first, Instagram present, YouTube for proof

| Platform                | Reach in the target (Pew 2025)                     | Role                                               | What to post                                                                                                                                                                                                                                           | Cadence                                                            |
|-------------------------|----------------------------------------------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| Facebook                | 79% of 50-64 - 69% of 65+                          | Primary. Paid + organic + neighborhood groups.     | Rain-day 'is your yard holding water?' posts within 12 hours of a storm; before/after with the Moasure map; 60-second explainers ('why the water sits at your slab'); customer thank-yous with names (permission); crew at work; the Drain Check plan. | 3 organic posts/week; 1 boosted rain post per event; ads always on |
| Instagram               | 35% of 50-64 - 19% of 65+                          | Secondary. ## Ad targeting and creative that fits the demographic

- Targeting: 20-mile radius of 70808, ages 50-75, homeowners; exclude renters and under-35. Lead form with two fields (name, phone) - the app calls back; no long forms.
- Creative: a real Baton Rouge yard, Charlie's face, the printed map, the warranty line. No stock photos. Large type. The word 'engineer' and the phrase '1-year workmanship warranty' in every ad.
- Impact the model expects: about 11 leads and 2 jobs a month at \$600, rising with Crew 2 - roughly \$8,400 of monthly install revenue from a \$600 spend, plus the plan customers those jobs become. Measured, not assumed: every lead is tagged by source in the app.

# Drain Check: the recurring book that sells the company

**\$249**

per annual visit; Angi 2026 hydro jetting \$350-600 (avg \$475) - priced under market on purpose

**72%**

gross margin per visit: one tech, two hours, jetter already owned, fuel and water (\$70 cost)

**\$895**

five-year gross profit per plan customer, before the referral one in four of them sends

**\$29K**

year-2 plan revenue at 40% attach on new installs plus 15% of past customers

## How it is sold - three moments, all automated

- **On the quote:** a line under the warranty - 'Drain Check: we come back every year, jet the lines, test the flow, \$249.' Pre-checked on the proposal; the customer removes it rather than adds it.
- **At the 11-month warranty walk:** the app schedules the walk, the tech does the first jetting as part of it, and offers the plan at the door. This is also the referral ask.
- **After every rain event:** past customers without a plan get one text: 'Your drain is 2 years old - want it jetted before the next storm?'

## Why it matters more than its revenue line

- **Cash flow smoothing:** plans are scheduled into the weeks installs are thin (August heat, December). A crew member with the jetter does 4-5 visits a day - \$806 of gross profit on a day that would otherwise be idle.
- **Retention and referrals:** a customer you see every year refers; one you saw once does not.
- **Enterprise value:** a contractor with 150-300 recurring-service customers and a documented process is bought as a business, not as a truck and a mini-ex. Recurring revenue is what a buyer pays a multiple for.
- **Scalable:** it does not need Charlie. It needs a checklist (in the app), a tech, and the jetter. That is the first job a Crew 2 lead can own.

# Crew 2 without betting the company

## The trigger, not the date

Crew 2 starts when three things are true at the same time, all visible on the dashboard: Crew 1 has installed 900+ LF for three consecutive months; backlog has exceeded four weeks for two consecutive weeks; and cash is above two months of overhead (about \$23,400). In the base case that is month 7. If demand lags, the date moves and nothing is lost.

| Step         | What                                                                                                                                                                          | Cost / timing                                                        | Safeguard                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| 1. Lead      | Promote Crew 1's best hand to Crew 2 lead; hire two laborers at \$20-22                                                                                                       | Hiring + 2 weeks shadowing: \$4,500 one-time                         | Readiness gate and breakdown flow let a lead run a job without Charlie on site    |
| 2. Equipment | Buy the trailer (\$9.5K), a used 3/4-ton truck (\$35K) and tools (\$6K) at start; rent a 3.5-4 ton mini-ex (~\$2,000/mo) and a skid steer (~\$1,700/mo) for the first 90 days | Month 7: \$10,100 down; ~\$3,700/mo rent                             | No machine loans until Crew 2 proves it; live rental rates and on-hand in the app |
| 3. Own       | Buy the used mini-ex (~\$50K) and skid steer (~\$38K), 80% financed over 60 months; Crew 2 now owns the same set Crew 1 has                                                   | Month 10: \$17,600 down; all loans ~\$2,300/month; paid off month 70 | Only after Crew 2 hits 900 LF twice; otherwise keep renting                       |
| 4. Marketing | LSA and Meta budgets x1.6 from Crew 2's start month                                                                                                                           | \$1,500 -> \$2,400 paid + \$300 content                              | Cost per job by channel on the Monday dashboard; cut what does not convert        |
| 5. Territory | Split the 20-mile circle: Crew 1 south/east (70808, 70810, 70817, Prairieville), Crew 2 north/west (Central, Zachary, Port Allen)                                             | Parish landing pages go live the same month                          | Less windshield time per LF - the second productivity lever                       |

**The productivity lever nobody talks about: at \$22.50/hr the difference between 900 and 1,000 LF a month is three points of margin. Trucks that leave loaded, machines that do not sit broken, and quotes that do not need a second visit are worth more than a price increase.**

# Equipment: from renting to owning Crew 2's set

| Crew 2 item                  | Buy price | Rent / mo | Months rented | Rent paid first | Bought in month | Down (20%) | Loan / mo | Paid off | Own beats rent after |
|------------------------------|-----------|-----------|---------------|-----------------|-----------------|------------|-----------|----------|----------------------|
| Mini excavator (used)        | \$50,000  | \$2,000   | 3             | \$6,000         | month 10        | \$10,000   | \$830     | month 70 | 25 months            |
| Skid steer / CTL (used)      | \$38,000  | \$1,700   | 3             | \$5,100         | month 10        | \$7,600    | \$631     | month 70 | 22 months            |
| Dump trailer 7x14 (new)      | \$9,500   | \$600     | 0             | -               | month 7         | \$1,900    | \$158     | month 67 | 16 months            |
| Truck 3/4-ton (used)         | \$35,000  | -         | 0             | -               | month 7         | \$7,000    | \$581     | month 67 | n/a                  |
| Tools, laser, compactor, PPE | \$6,000   | -         | 0             | -               | month 7         | \$1,200    | \$100     | month 67 | n/a                  |
| Total                        | \$138,500 |           |               | \$11,100        |                 | \$27,700   | \$2,300   |          |                      |

## The timeline

- **Month 7 - Crew 2 starts.** Buy what is cheap and holds value (trailer, truck, tools: \$10,100 down). Rent the two machines (~\$3,700/month) from the yard the app shows has them on hand.
- **Months 7-9 - prove it.** Crew 2 must hit its target LF in two consecutive months. Rent paid in this window (\$11,100) is the price of not owning a machine for a crew that did not work out.
- **Month 10 - own it.** Buy the used mini-ex and skid steer, 80% financed: \$17,600 down, then ~\$2,300/month for everything, paid off in month 70. From month 10 both crews run identical, owned sets.
- **Why own at all:** a \$50,000 mini-ex vs. \$2,000/month rent breaks even at 25 months; the skid steer at 22. Anything a crew will run for two years should be owned - and it outlasts the loan by years. Renting is a 90-day insurance policy, not a strategy.
- **Cash check:** the month-10 down payment is the only month in the plan with a materially negative swing, and the balance never drops more than a few thousand below the opening \$25,000 (Proforma tab, 'Cash balance').

# The proforma, summarized

|                                               | Q1        | Q2        | Q3        | Q4        | Year 1    | Q5-Q6     | Q7-Q8     | Year 2      |
|-----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-------------|
| Linear feet installed                         | 1,500     | 2,400     | 4,600     | 5,400     | 13,900    | 10,800    | 10,800    | 21,600      |
| Install revenue                               | \$103,116 | \$127,186 | \$249,023 | \$270,419 | \$749,744 | \$540,837 | \$540,837 | \$1,081,674 |
| Drain Check revenue                           | \$89      | \$875     | \$2,157   | \$3,754   | \$6,875   | \$11,917  | \$16,775  | \$28,692    |
| Total revenue                                 | \$103,205 | \$128,061 | \$251,181 | \$274,173 | \$756,620 | \$552,754 | \$557,612 | \$1,110,366 |
| Direct costs (labor, materials, fuel, visits) | \$62,360  | \$67,395  | \$133,835 | \$138,563 | \$402,154 | \$278,366 | \$279,731 | \$558,097   |
| Gross profit                                  | \$40,845  | \$60,666  | \$117,345 | \$135,610 | \$354,466 | \$274,388 | \$277,881 | \$552,269   |
| Overhead incl. owner draw, marketing, Crew 2  | \$34,500  | \$35,100  | \$55,916  | \$44,700  | \$170,216 | \$89,400  | \$89,400  | \$178,800   |
| Operating profit                              | \$6,345   | \$25,566  | \$61,429  | \$90,910  | \$184,250 | \$184,988 | \$188,481 | \$373,469   |
| Cash balance, end of period                   | \$28,752  | \$53,756  | \$102,180 | \$175,240 | \$175,240 | \$360,228 | \$548,709 | \$548,709   |

| Scenario (month-24 run rate)         | Conservative   | Base - Charlie's goal | Stretch          |
|--------------------------------------|----------------|-----------------------|------------------|
| LF per crew / crews / \$ per LF      | 700 / 1 / \$38 | 900 / 2 / \$42        | 1,000 / 2 / \$46 |
| Monthly revenue                      | \$32,330       | \$91,868              | \$112,905        |
| Operating profit per year (run rate) | \$2,312        | \$367,613             | \$568,563        |
| Operating margin                     | 1%             | 33%                   | 42%              |

Conventions: revenue in month of install; 30% deposit at signing, 90% of the balance in the month of completion, 10% the month after; payroll burden 14%; labor = crew wages x hours x burden per active crew (switchable to a flat 32% of revenue); \$50/LF all-in; other work at \$1,000/crew-day fills days not used by drains; no income tax modeled (pass-through). Owner draw \$6,000/month is inside overhead. Crew 1's equipment is owned (no capex); Crew 2's purchases total \$138,500 with \$27,700 down. The growth-and-operations lead line is left at \$0 - terms to be agreed separately.

# Cash flow: how the growth pays for itself

## \$23,135

lowest cash balance in 24 months (month 1)  
against a \$25,000 opening balance

## \$175,240

cash at end of year 1, after Crew 2's rental,  
hiring and the equipment down payment

## \$548,709

cash at end of year 2 - the buffer that funds  
Crew 3, a second jetter, or a buyout  
conversation

### Rules that keep it that way

- **30% deposit by text at acceptance, balance link the day the flow test passes.** The app sends both; nobody chases a check. Cash arrives the same month the labor is paid.
- **Two months of overhead in the bank before any hire or purchase** (about \$23,400). The dashboard shows the number; the rule is written down.
- **Rent before buy, finance before cash.** Crew 1's trailer, skid steer and mini-ex are already owned. Crew 2's machines are rented for 90 days, then bought at 80% financing over 60 months; total loan payments of ~\$2,300 a month against a crew that produces \$22,096 a month in gross profit is the right ratio.
- **Drain Check is prepaid.** Annual plans are billed at signing or at the visit; either way the cash comes before the cost, and the visits are scheduled into thin weeks.
- **Buy materials off the live comparison, pay in the month of install.** A 10-15% swing in aggregate and pipe across the parish is real; the app shows it before the truck rolls.
- **Open a line of credit while you do not need it** (year 1, when the bank sees the deposits). It is the backstop for a wet spring that books three crews of work at once.

# Your proposal template stays. The software feeds it.

Charlie's proposal is the customer-facing document and it is not changing. Scag Scapes Command sits behind it: it answers the phone, books the estimate, takes the Moasure survey, prices the job, produces the numbers and the map for the template, collects the deposit, schedules the crew, buys the materials, asks for the review and sells the Drain Check plan. Every setting that drives this plan is a field in the app, not a line of code.

| Step in the day                     | What Command does                                                                                                                                                | Setting Charlie controls                                |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Phone rings while he is in a trench | Text-back in 60 s with the price range and two open slots; homeowner picks one by replying                                                                       | Price range, hours, slot times, message wording         |
| Estimate visit                      | Moasure survey: export CSV from the Moasure app, import into the quote builder - run length, fall and the 1% slope check fill in automatically (built this week) | Slope minimum, waste factor, materials list per service |
| Proposal                            | Numbers and BOM go into Charlie's own template; the Moasure PDF (with logo, scale and elevations) is attached                                                    | Deposit %, warranty wording, inclusions and exclusions  |
| Sold                                | Deposit link by text; job requirements list from the survey; readiness gate before the truck leaves                                                              | Approval limits, crew assignments                       |
| On site                             | Breakdown flow, live rental and material comparison, call packages                                                                                               | Recovery weights, crew cost per hour, preferred vendors |
| Done                                | Balance link, review ask, Drain Check offer, 11-month warranty walk scheduled, referral ask                                                                      | Timing of each message, plan price                      |
| Every Monday                        | Dashboard: speed-to-lead, leads and cost per job by channel, close rate, LF per crew, margin per job, plan attach, cash                                          | Which KPIs are on the front page                        |

**Moasure has no public API (checked Sept 2026); it exports PDF, DXF/DWG, CSV point clouds and images. The CSV import is live in the quote builder now; the next step is a job-record attachment so the survey, the proposal and the flow-test photo live together for the warranty walk.**

# Data and analytics: what Charlie sees, and how he changes it

| Question                         | Metric on the dashboard                                           | Target                                                                                        | If it drifts                                                                                  |
|----------------------------------|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Are we answering fast enough?    | Speed-to-lead (median seconds to first text and to first human)   | < 60 s text; < 5 min human                                                                    | The app already texts; check call-back habits                                                 |
| Are the ads working?             | Leads, jobs and cost per job - by channel                         | < \$450 per job blended                                                                       | Move budget between LSA and Meta; pause a channel for 2 weeks                                 |
| Are we closing?                  | Estimates run and quote-to-sale, by channel and by ZIP            | 70% of estimates (Charlie's number); leads-to-estimate 50% search / 30% social / 65% referral | Look at price-per-LF outliers and quote turnaround; compare to the yellow cell on Assumptions |
| Are crews productive?            | LF per crew per day; jobs needing a second visit; breakdown hours | 43+ LF/day; < 5% revisits                                                                     | Readiness gate compliance; breakdown response times                                           |
| Are we making money on each job? | Gross margin per job vs. quoted; materials variance               | 48% +/- 3                                                                                     | Materials price alerts; discount discipline (the app shows margin impact before a discount)   |
| Is the recurring book growing?   | Drain Check attach rate; active plans; visits due this month      | 40% attach; 150 active by month 24                                                            | Put the plan back on the proposal first page; warranty-walk script                            |
| Are we safe?                     | Cash balance vs. two-months-overhead rule; backlog weeks          | Cash > \$23,400; backlog 2-4 weeks                                                            | Backlog > 4 weeks for 2 weeks = the Crew 2 trigger                                            |

## Changing the plan takes a minute, not a developer

- Price per LF, deposit %, rain threshold, message wording, approval limits, recovery-option weights, crew cost per hour, plan price - all are settings screens in the app. Change one, and every quote, text and ranking uses it from that moment.
- The proforma workbook is the same idea on paper: yellow cells are the levers, everything else recalculates. Charlie's real figures replace the estimates as the dashboard produces them - month by month the model becomes his actuals.
- Reports page exports: leads by source, jobs by ZIP, margin by job, plan customers, provider performance. Every number is traceable to the record it came from - no black box.

# Twelve-month roadmap with kill criteria

| Quarter         | Build                                                                                                                                               | Sell                                                                                                | Measure                                                | Go / no-go at quarter end                                                                  |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Q1 (months 1-3) | Phone, deposit and review links live; price range and warranty published; GBP verified; Moasure import in every quote; Drain Check price and script | LSA on month 1, Meta month 2; every quote through Command; plan offered on every quote from month 3 | Speed-to-lead, cost per job by channel, close rate     | Go if 100% of leads answered, cost per job < \$500, Crew 1 at 750+ LF in month 3           |
| Q2 (4-6)        | Parish pages; YouTube proof library; readiness gate and breakdown flow on the crew phones; warranty-walk automation                                 | Rain campaigns measured per event; reviews to 25+; plan sold at every warranty walk                 | LF per crew-day, backlog weeks, plan attach            | Go for Crew 2 if 900 LF three months running, backlog > 4 weeks, cash > 2 months overhead  |
| Q3 (7-9)        | Crew 2 hired and shadowed; mini-ex rented; territory split; marketing x1.6                                                                          | Both crews fed by the same funnel; commercial intros (HOAs, property managers) begin                | Crew 2 ramp vs. plan, utilization of both crews, cash  | Buy the machines only if Crew 2 hits 900 LF twice; otherwise keep renting or pause         |
| Q4 (10-12)      | Mini-ex and skid steer purchased and financed (Crew 2 now owns its full set); second jetter if plan visits exceed 20/month; line of credit opened   | Referral partners (WCK, roofers, gutter companies, realtors); Drain Check to past customers         | Year-1 actuals vs. proforma; plan book; margin per job | Decide Crew 3 trigger, price increase (reviews + map justify \$46/LF), or hold and harvest |

## Risks and the safeguard for each

- **A dry season.** Rain drives demand. Safeguard: Drain Check visits and the referral ask fill dry months; marketing budget is monthly, not committed.
- **Crew 2 does not perform.** Safeguard: rent-first, buy only after two target months; the lead is promoted from Crew 1, not hired cold.
- **Lead cost creeps up.** Safeguard: cost per job by channel on the Monday dashboard; a two-week pause rule; organic share grows every month.
- **Charlie becomes the bottleneck.** Safeguard: the software answers, books, prices and schedules; the readiness gate lets a crew lead run a job; the plan business needs a tech, not the owner.
- **Price pressure from the New Orleans firms.** Safeguard: they cannot bring a map, a warranty term or a 60-second answer. Sell the engineer, not the foot of pipe.
